**INTERNATIONAL PRELIMINARY
EXAMINATION REPORT - SEPARATE SHEET**

International application No. PCT/CA98/00314

1. From the description (see pages 3-5) it becomes clear that the photoreactor of the present application comprises a closed tubing system including (i) a venturi means for constraining the gas stream and increasing its velocity while simultaneously creating a suction effect, (ii) a photocatalyst positioned downstream of the venturi means transversely with respect to the gas stream and (iii) an UV light source for illuminating the photocatalyst.

A main independent claim directed to a photoreactor and including the above essential features expressed in a clear manner is regarded as meeting the requirements of Art. 33 PCT. Present claim 21 can be used as a basis for such a clearly drafted independent claim 1.

The above remarks apply in an analogous manner to the drafting of an independent method claim.

The documents cited in the Search Report fail to disclose or fairly suggest such a photoreactor. None of them points towards employing a venturi means and the beneficial effects of the suction created within the venturi means.

2. Present claim 1 is unclearly drafted (Art. 6 PCT) since it does not include the above essential features expressed in a clear and exact manner. More specifically the wording " means for constraining ... a suction effect" is too general and vague and not in accordance with the description where only a venturi means causing a suction effect is described.

The wording "means for irradiating ...stream" is also vague since it does not express clearly that the organic air borne pollutants are destructed by means of the photocatalyst which is irradiated by UV light.

3. Statements in the description (see page 5, lines 27-30) not in accordance with the wording of the claims cause unclarity (Art. 6 PCT).
